

## Enterprise Continuous Integration and Build Management

OpenMake® Mojo provides enterprise class continuous integration and distributed workflow, enabling teams to easily automate and manage complex multiplatform software development processes. Mojo supports remote distribution of workload across multiple machines, centralizes reports and logs, and facilitates teamwork through improved workflow handoffs. With best of breed commercial and open source ALM tool plug-ins, Mojo provides a platform for orchestrating any application lifecycle process. Its distributed workflow platform can scale to any number of remote agents, which can be hosted on physical or virtual machines in the enterprise cloud computing environment. Mojo is easy to configure for continuous integration and distributed workflow, with new projects taking as little as 10 minutes to configure.

Mojo Process Automation

### Easy to Configure Continuous Integration

With Mojo, you start with your existing build scripts, add some basic information about where and how to retrieve source code - and start building. You can execute builds on a schedule, based on source code changes, or even based on custom criteria. Mojo enables you to quickly configure complex build workflows to automate your build, test and deploy activities - eliminating costly manual procedures. Most of our customers report that Mojo takes less than 10 minutes to configure per project - and fast setup means fast benefits for your team.

### Best of Breed Tool Plug-ins

OpenMake Mojo has a broad collection of built-in tool integrations, more than any commercial or open source continuous integration system. With support for all popular open source and commercial source control systems, getting your source code staged and ready to build is easy. Mojo also has plug-ins for testing, notification and deployment activities, just to name a few. Plus, if there's a tool that we don't support out-of-the-box, writing your own integration is a snap - no Java or other coding is required. Let Mojo automate your development steps and take the guesswork out of your build to release process.

### Fast, Distributed Build Processing

Executing your build process on a single machine is easy for any continuous integration system. But when the build process is complex and needs to span multiple machines, Mojo extends that ease of use to enable you to create massively distributed build and workflow configurations. You install the Mojo remote agent software on the build machine, and it is immediately ready to process workflow tasks. Mojo also takes advantage of individual processors on any one machine, which further speeds up builds by running independent tasks on their own processor core - all with no special configuration requirements. With standard support for virtual and cloud computing environments, Mojo enables you to optimize your distributed build processing architecture.

### Enterprise Scalability

Unlike other build management tools, OpenMake Mojo provides enterprise class scalability, enabling teams to start small and build up to a large, distributed build farm. With its remote agent technology, Mojo lets you take an existing build machine, install our remote agent software, and immediately add that build machine to your build farm. Mojo also provides direct support for cloud computing environments, so physical, virtual, on-site and hosted machines can all participate in improving your software build processes.

## Simple Licensing Model

OpenMake Mojo delivers enterprise scale continuous integration and distributed workflow through a simple licensing approach. Mojo Standard is available for free, unlimited use, so that your team can enjoy the benefits of Mojo without any risk. As your needs grow, Mojo Professional or Mojo Enterprise offer simple, bundled packages to expand your build farm at an affordable price. The chart below outlines the details of our no-nonsense licensing model.

Mojo Pricing			
	Standard	Professional	Enterprise
<b>Agents:</b>	1	5	25
<b>Price:</b>	\$0	\$2495	\$7995
<b>Annual Maintenance:</b>	\$399	\$1295	\$3995

Software Configuration Management Tool Integrations	
• Accurev	• MKS Source
• CA SCM (Harvest)	• Serena PVCS
• CVS	• Serena Dimensions and Dimensions Express
• IBM ClearCase	• Perforce
• Microsoft Team Foundation Server	• Borland StarTeam
• Microsoft Visual Source Safe	• Subversion

Requirements, Testing, and Deployment Tool Integration	
• CA Software Delivery	• Jira
• Bugzilla	• JUnit
• CheckStyle	• JCoverage
• Crap4J	• JDepend
• Doxygen	• Maven and Ant
• Emma	• Nunit
• FindBugs	• PMD
• IBM® ClearQuest	• Serena Tracker
• IBM Tivoli	• Serena Mover
• Japex	• Any Shell Command
• Make, NMake, CMake, EMake, OMake, IMake
