OpenMake Software and Creoss join forces improving Agile Development

OpenMake Software and Creoss announce partnership with a focus on improving the Agile Development Ecosystem

Chicago, August 5, 2008– OpenMake Software, a leading provider of build to release management solutions, today announced their partnership with Creoss, a service based company with a focus on the triangular relationship between SOA, BPM and Agile development. Creoss is the creator of Rhythm, an Agile Software Execution Framework that has a strong emphasis on a unified build infrastructure (UBI), which OpenMake Meister supports.

"Rhythm's Unified Build Infrastructure promotes the use of standardized build methods creating a continuous build process that is fast, consistent and repeatable. OpenMake Meister delivers builds that meet the requirements of Rhythm's UBI" states Steve Taylor, CTO, OpenMake Software. "Meister is a perfect fit for the Rhythm agile framework and gives our customers a great example of how agile development can be improved through better build management."

"Customers can yield tremendous productivity and competitive advantage by simplifying their 'Build Management' process. Our relationship with OpenMake Software allows Creoss to provide our customers with a simple and elegant build solution" stated Martin Gossen, Principal, Creoss Business Solutions. The Meister solution is truly a full life-cycle build management technology. Knitting this technology to our Rhythm Software Execution framework allows us to provide the industry with a build management process that brings an instant return on value. This is what our customers expect of Creoss and our relationship with OpenMake Software allows us to exceed customer expectation."

About OpenMake Software

OpenMake Software has been an innovator of build and release management solutions for global 2000 organizations since 1995. By managing more build engines, such as MSBuild and Ant, OpenMake Software represents the natural virtualization of the application build process derived directly from popular IDEs such as Microsoft Visual Studio and Eclipse. Putting workflow on top of chaos does not solve the build problems. OpenMake Software provides free workflow management with Mojo, but addresses the entire build management challenge with Meister.

About Creoss

Creoss is a technology consultancy based in Denver, Colorado with a focus on providing developers a clear path to Business Agility. Creoss leverages SOA to enable business agility, BPM to foster business flexibility, and a unique Agile method for business responsiveness. Creoss refers to these three pillars as "Service Orientation, Service Orchestration and Responsive Ecosystem". For more information go to www.creoss.com.
